

Singly Linked Lists - Length

- # of nodes in a linked list

Logic:

- Start from beginning of the list, Set a current node to the head of the list and go through each of the nodes until we hit null, and we will keep a running tally of how many nodes we've encountered.

Length Iterative

```
def length_iterative(self):
```

```
    count = 0
    current_node = self.head
    while current_node:
        count += 1
        current_node = current_node.next
    return count
```

Annotations for iterative method:

- `count = 0`: Keep track of the # of loops we perform
- `current_node = self.head`: Set current node to the front of the list.
- `while current_node:`: While still a valid node object (loop thru linked list)
- `count += 1`: Keep updating number of times we loop
- `return count`: Return the count of nodes

Length Recursive

```
def length_recursive(self, node):
```

```
    if node is None:
        return 0
    return 1 + self.length_recursive(node.next)
```

Annotations for recursive method:

- `if node is None:`: Base Case
- `return 1 + self.length_recursive(node.next)`: Call recursive, then pass in the next node
